No Big Deal?*

Kelly A. Malloy, OD, FAAO, Diplomat

3

Disclosure statement:

I have no financial disclosures within the past 2 years.

4

5

6

27 YEAR-OLD WOMAN

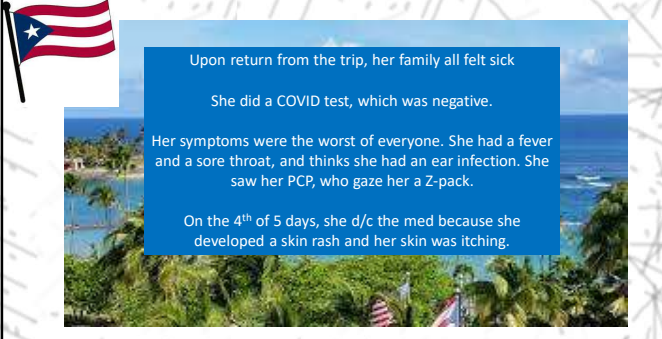

Presents urgently with a few complaints x 2-3 weeks

1. Flash in peripheral vision of OD
 - Like the phone camera (3x/hr now)
2. Blurry vision, smudge OD
3. Headache (frontal) last week (resolved)
 - No eye pain (w or wo mvmt)

She recently traveled to Puerto Rico with her family and returned home 2-3 weeks ago.

7

Upon return from the trip, her family all felt sick

She did a COVID test, which was negative.

Her symptoms were the worst of everyone. She had a fever and a sore throat, and thinks she had an ear infection. She saw her PCP, who gave her a Z-pack.

On the 4th of 5 days, she d/c the med because she developed a skin rash and her skin was itching.

8

Hx of anemia. No other known health problems

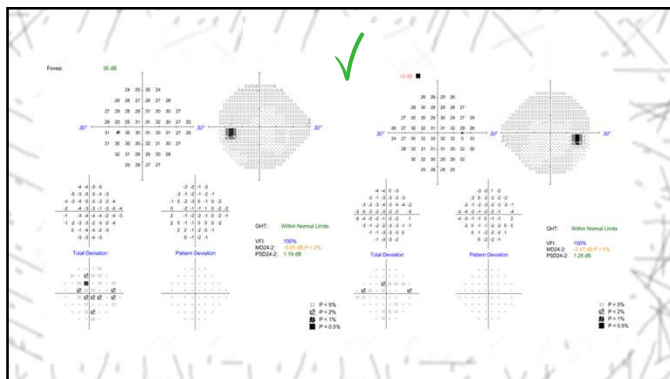

Initial Visit

28

Types of Optic Neuritis

Periopic Neuritis

Swollen optic disc
Visual function varies (can be good)
Can be painful

Most commonly due to

- Idiopathic
- Sarcoid
- Syphilis
- IgG4RD
- GPA
- GCA
- Behcet's
- Lupus
- TB
- Leukemia
- Herpes
- Viral encephalopathies
- Metastatic malignancy

Neuroretinitis

- Swollen optic disc
- Acute change in vision
- Painless
- Many have upper resp. infxn.
- Peripapillary exudative RD
- Macular star not present for 2 wks.

Most commonly due to:

- Cat Scratch
- Sarcoid
- Syphilis
- Lyme
- Toxo
- TB

Neither are ever related to MS!

We will initially focus on infectious processes

29

- Lyme
- Toxo
- TB

Neither are ever related to MS!

She has already had symptoms for a few weeks, and there is no macular star.

We will initially focus on infectious processes

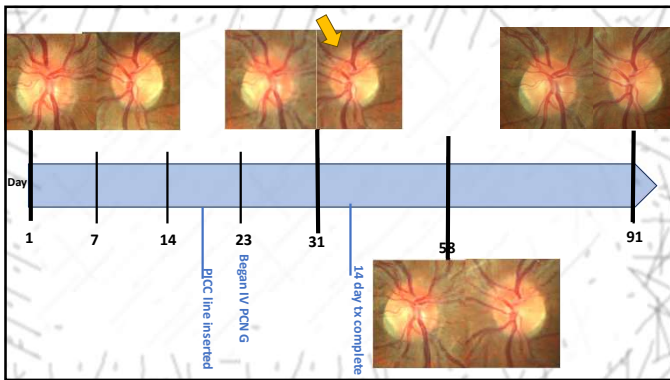

30

37

38

39

Be sure to include syphilis in your DDX. It can take on various presentations. (also remember congenital syphilis)

Syphilis rates are on the RISE, across the US (and in PR)

Syphilis is easily treatable and doesn't leave lasting effects if identified and treated early!!

Also, the stigma of STIs doesn't just happen from the patient side, it also comes from clinicians — many physicians think, "my patient doesn't have syphilis."

<https://publichealth.jhu.edu/2024/why-is-syphilis-spiking-in-the-us>

40

41

44 YEAR-OLD MAN

Referred to rule-out papilledema vs anomalous optic discs

He denies every symptom of increased ICP, or any other symptoms.

Health history is remarkable only for obesity for which he has been taking Wegovy for the past year. He has lost 75 lbs so far.

DOI: 10.1001/jamaophthalmol.2024.2296

Key Points

Question Are prescriptions for semaglutide associated with an increased risk of nonarteritic anterior ischemic optic neuropathy (NAION) in patients with type 2 diabetes or patients who are overweight or obese?

Findings This matched cohort study of 16,827 patients revealed higher risk of NAION in patients prescribed semaglutide compared with patients prescribed non-glucagon-like peptide receptor agonist medications for diabetes or obesity.

Meaning The findings suggest a potential risk of NAION associated with prescriptions for semaglutide, but future study is required to assess causality.

Abstract

Importance Anecdotal experience raised the possibility that semaglutide, a glucagon-like peptide 1 receptor agonist (GLP-1 RA) with rapidly increasing use, is associated with nonarteritic anterior ischemic optic neuropathy (NAION).

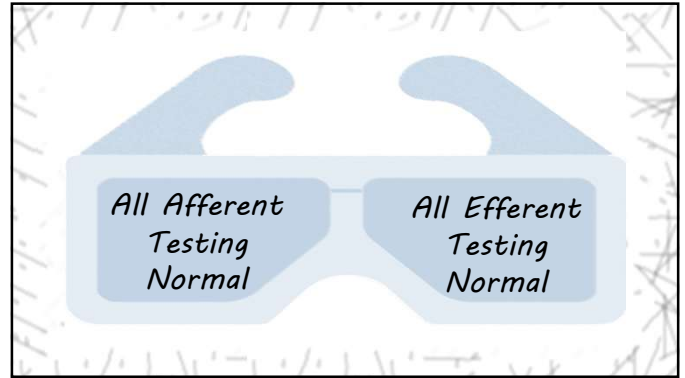

Objective To investigate whether there is an association between semaglutide and risk of NAION.

Glucagon-like peptide-1 (GLP-1) agonists are a class of medications utilized to treat type 2 diabetes mellitus (T2DM) and obesity.

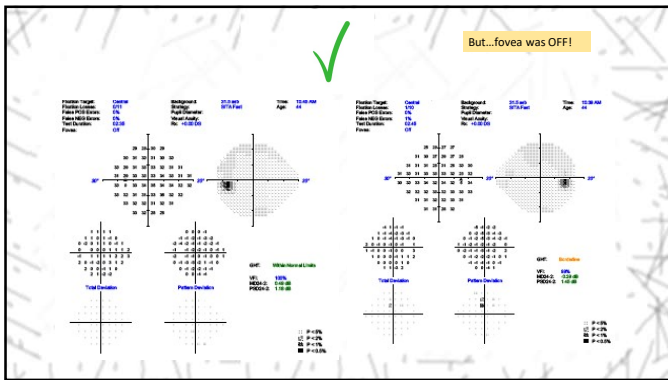

FDA-approved GLP-1 receptor agonists for glycemic control include:

- Dulaglutide (subcutaneous-SC)
- Exenatide injectable solution subcutaneous.
- Exenatide injectable suspension SC.
- Liraglutide SC.
- Liraglutide/insulin degludec.
- Lixisenatide/insulin glargine.
- Semaglutide (oral, SC)
- Tirzepatide (dual GIP/GLP-1 receptor agonist)

94

95

96

97

98

99

100

15 YEAR-OLD BOY

Referred for irregular eye movements in the setting of two recent concussions

1. Three months ago
 - Helmet to helmet
 - Made a few more plays and then pulled out
 - Headache, neck pain
 - Initial eye shaking that resolved

101

15 YEAR-OLD BOY

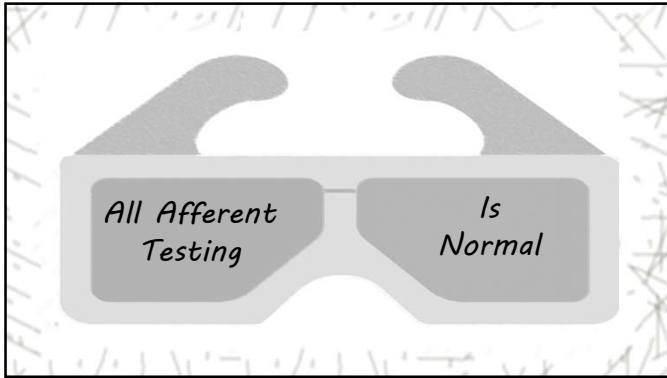

2. Two months ago
 - During practice, a teammate hit his helmet with their helmet

The next day at the game, his teammates were concerned because he was slurring his speech and not acting normal

 - He was pulled from the game, and has not played since

102

103

Mild Traumatic Brain Injury (mTBI)

- An acute brain injury resulting from mechanical energy to the head from external physical forces.

Concussion = Mild TBI

- Can be associated with confusion, amnesia, and loss of consciousness

Does NOT have to be associated with loss of consciousness

104

SECOND IMPACT SYNDROME

Suffering a second traumatic brain injury in close time proximity to a primary brain injury

Exacerbates neuronal injury in cells made vulnerable by the initial TBI

Diffuse cerebral swelling develops in the setting of a second concussion, which has occurred when a patient is still symptomatic from an earlier concussion.

Disordered cerebral autoregulation causing cerebrovascular congestion and malignant cerebral edema with increased intracranial pressure

Rare, but potentially FATAL

This is why it is so important for an athlete to be immediately removed from play after head trauma!

Athletes will hide symptoms to try to stay in the game.

105

TBI and VISUAL SYMPTOMS

- visual symptoms occur in MOST (75%) individuals with concussion
- blurred vision, poor visual focus, difficult reading, diplopia, rarely shaking vision (i.e., oscillopsia), photophobia, intolerance of visual activities, headaches, and dizziness.
- Poor tolerance of visual activities such as screen use and scrolling on smart phones is common

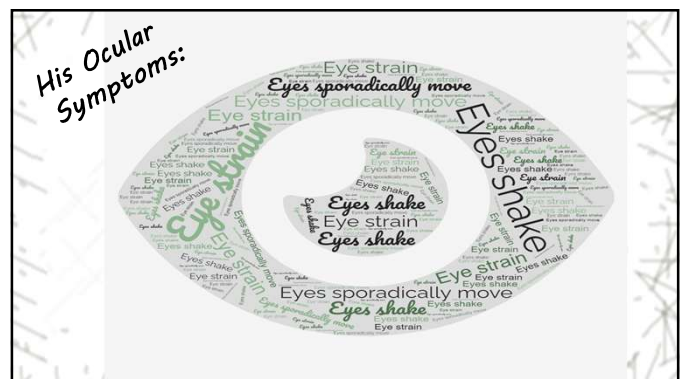

106

TBI Symptoms / Post-Concussion Syndrome

<ul style="list-style-type: none"> Eyestrain Headache Blur Diplopia Loss of concentration Sleepiness Dizziness 	<ul style="list-style-type: none"> Balance Issues Light Sensitivity Noise Sensitivity Anxiety Depression Difficulty Making Decisions Sleep Disturbance
---	---

Although most symptoms will resolve with time, 15% of mTBI patients have disabling symptoms after 1 year!

107

108

115

116

117

Findings Not Typically Associated With Nystagmus

ATYPICAL!!

- Excessive Blinking
- Mouth Movements
- Audible Sounds
- Fatiguability (Not Sustained)

RED HERRING?

False leads started to become known as "Red Herrings" in the early 1800s when an English journalist named William Cobbett used the term to compare the media's practice of using misleading information to distract voters from the rising rabble.

118

Conversion Disorder?

- A condition in which a patient shows psychological stress in physical ways.
- A health problem that starts as a mental or emotional crisis — a scary or stressful incident of some kind — and converts to a physical problem.

119

Risk Factors for Conversion Disorders

- Stress or emotional trauma
- Female
- Adolescent or young adult
- Mental health conditions
 - mood /anxiety disorders, dissociative or personality disorders
- Family member with conversion disorder
- History of physical or sexual abuse
- Financial problems

120

FUNCTIONAL VISION DISORDER (FVD)

– Manifestations (**USUALLY AFFERENT**)

- **Visual field loss**
 - Generalized constriction
 - Homonymous hemianopia
- **Reduced visual acuity** (wide variability)
 - Blur
 - To blindness
- **Abnormal eye movements** (**EFFERENT - less common**)

subjective
vs.
objective

121

To ask the right question is already half the solution of a problem.
 — Carl Jung —

122

123

124

At least, not a physiologic problem related to his eyes...

125

129

130

131

132

133

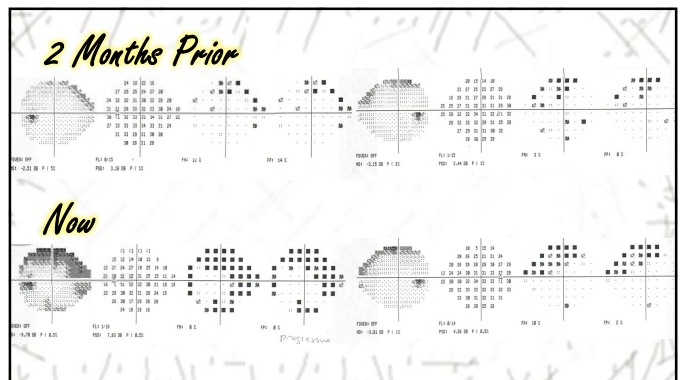

134

31 YEAR-OLD WOMAN

Referred by local optometrist
- She works in his office

- Unexplained vision loss
 - reduced VA OS
 - progressive VF loss OS
- Abnormal eye movements

135

136

- Migraines since 1st grade
- 1 year ago
 - increase in migraines
 - Episodes of nearly passing out
- Went to ER after bad migraine episode
 - Had 1st MRI of brain ever
 - Dx with Arnold Chiari malformation

Arnold-Chiari type I Malformation

- Chamberlain's line
- Herniation of cerebellar tonsils thru FM
- Beaking of tonsils / brainstem changes
- Elongation of 4th ventricle

137

Chiari I Malformation

In this photo, the **blue** represents bones that make up the opening of the foramen magnum. The spinal cord is the only part of the CNS that should go through the foramen magnum. Here, we see the cerebellum in **purple**, and the cerebellar tonsils are herniating through the foramen magnum.

This constitutes a Chiari I Malformation.

<http://www.musculoskeletal.com/ortho/neurology/chiari-malformation>

138

Chiari I Malformation Symptoms

- Headache (suboccipital)
- Neck pain
- **Pain behind eyes**
- **Visual disturbances**
- **Diplopia**
- **Photophobia**
- **Nystagmus**
- Dizziness
- Hearing disturbances
- Weakness
- Paresthesias
- Ataxia
- Dysphagia
- **CN Palsies**
- Syncope

Chiari I malformation can have many visual signs and symptoms!

139

Chiari I Malformation Symptoms

- Pain behind eyes
- Visual disturbances
- Diplopia
- Photophobia
- CN Palsies
- **Nystagmus**
 - **DOWNBEAT**
 - Worse in down gaze and in lateral gazes
 - **PERIODIC ALTERNATING**

The likelihood of becoming symptomatic is proportional to the degree of descent of the tonsils. Patients with greater than 12 mm of descent are usually symptomatic, whereas approximately 30% of those whose descent measured between 5 and 10 mm remained asymptomatic.

140

- She reports that she had nystagmus (? type)
- Underwent Chiari I Malformation Decompression surgery

She reports that headaches and nystagmus resolved after surgery

141

- Migraine headaches returned 4 months later
- For past 5-6 weeks, transient visual blur OS
 - 1-2 x / day for up to 4 hours at a time
- For past 10 days
 - Constant blur OS
 - Pain OS when looking to the left
 - When covering OD, horizontal diplopia with OS

*Blar...
Pain...
Diplopia?*

142

Do we need to refer back to neurosurgery?

Keep looking until you find evidence you can "bank" on!

How do I manage functional visual loss

Neil Ramsay¹, Justin McKee², Gillian Ali-Ani³ and Jon Stone⁴

© The Author(s) 2024

Functional visual loss is a subtype of functional neurological disorder (FND) and is a common cause of visual impairment seen in both general and neuro-ophthalmological practice. Ophthalmologists can generally diagnose functional visual loss reasonably confidently but often find it harder to know what to say to the patient, how to approach, or even whether to attempt treatment. There is little evidence-based treatment despite studies showing up to 60% of adults having impactful symptoms on long-term follow-up. The last 20 years has seen large changes in how we understand, approach, and manage FND: more widely, in this article, we set out our practical approach to managing functional visual loss which includes: 1) Make a positive diagnosis based on investigations that demonstrate normal vision in the presence of subjectively impaired vision, not just because tests or ocular exam is normal; 2) Explain and label the condition with an emphasis on these positive diagnostic features, not reassurance; 3) Consider eye or brain comorbidities such as migraine, idiopathic intracranial hypertension or amblyopia; 4) Consider working with an orthoptist using diagnostic tests in a positive way to highlight the possibility of better vision; 5) Develop simple treatment strategies for photophobia; 6) Consider psychological factors and comorbidity as part of assessment and therapy, but keep a broader view of aetiology and don't use this to make a diagnosis; 7) Other treatment modalities including hypnotherapy, transcranial magnetic stimulation and more advanced forms of visual feedback are promising candidates for functional visual loss treatment in the future.

How do I manage functional visual loss

Neil Ramsay¹, Justin McKee², Gillian Ali-Ani³ and Jon Stone⁴

N. Ramsay et al.

1. Predisposing Factors

- Eye conditions – eg Diabetic retinopathy
- Brain conditions – eg HI, migraine
- Anxiety/Depression
- Functional Disorders
- Other Genetic factors
- Sensory life events/ childhood adversity
- Autoinflamm
- Sometimes NO vulnerability

2. Precipitating event

- Eye conditions
- Migraine
- Photophobia
- Mild traumatic brain injury

3. Comorbidities

- Eye/brain conditions
- Depression
- FND
- Anxiety/Agoraphobia
- PTSD
- Irritability
- Sleep Problems
- Dissociation
- Avoidance

4. Perpetuating Factors

- Feeling embarrassed
- Medical uncertainty
- Photophobia
- Medication
- Unnecessary surgery
- Lack of treatment
- Legal cases

5. Treatment

- Explanation of disorder
- Cognitive therapy
- Psychiatrist/Psychological Assessment/therapy
- Hypnotherapy

6. Recovery

7. Partial or No Recovery

How do I manage functional visual loss
 Neil Bannay¹, Aislin McKee², Lakshmi Arav³ and Jon Stone⁴

Table 1. Examples of helpful communication for functional visual loss and things to avoid – adapted from [10].

Communication issue	Example	Things to avoid
Naming the problem	"You have functional visual loss – this is a common issue and I'm going to explain to you what it is"	"You don't have a 'p', there's nothing actually wrong with the eye or brain!" "It's non-organic"
General explanations of functional visual loss	"This is a problem related to abnormal functioning of the brain. Your eyes are sending visual signals to the brain, but the brain is not letting you experience them"	Comparison to everyday physical symptoms like blushing often unhelpful
Use of metaphor	"It's a bit like a software problem on a computer rather than a hardware problem: 'Nothings damaged' – it's just not working properly"	All the tests are normal so that's good, isn't it?" "It's a psychological problem"
Use diagnostic tests to explain a 'rule in' diagnosis	"You have functional visual loss because I found evidence of it on the tests – let me explain. See all the examples in Table 1"	Psychological factors are risk factors rather than causes
Overcoming doubt	Physician: "So, are you saying it's psychological?" Patient: "No, I'm saying it's a condition that shows that the mind and the brain are one and the same thing"	Not talking about mechanism for experiencing better vision, but we need to find a way of retaining your brain so that this can happen"
Talking about mechanism before etiology and introducing hope	"The fact that you have diabetic retinopathy, have had migraine that affects your vision and the mental health problems you described are all likely to be relevant to why this has happened"	"We need to figure out what your psychological trauma has been so we can treat you!"
Discussing physical and mental health risk factors	"People with functional visual loss often have light sensitivity. We think it's your brain trying to shut down visual input when its feeling overwhelmed"	"You must take those dark glasses off – they are just making the problem worse!"
Talking about photophobia	Copy your letter to the patient. Support to resources on functional visual loss and FVLO – eg www.vision.org.uk	"Because there's nothing wrong then it should just get better!"
Providing information	"This is not an easy problem to put right, but it does have the potential to improve, and many people do make a good recovery"	
Prognosis	My ophthalmic colleague can spend longer exploring things and going through the tests with you. They may be able to start using the tests to help improve better vision"	
Orthoptic treatment	Psychology/psychiatry can sometimes help people with functional visual symptoms to look for risk factors such as anxiety or depression that could be making the brain problem worse. What do you think?"	"This is a mental health problem; I'm sending you to psychiatry!"
Psychological referral	Hypnotherapy has a strong scientific basis. It can be a way of putting the brain in an altered state that might allow you to have better vision. You can be taught self-hypnosis that might help"	"You could explore complementary therapies like hypnosis"
Talking about hypnotherapy

74 YEAR-OLD WOMAN

- Presents emergently with her husband and sister for vision loss OS x 8 days
- Systemic Hx:
 - Alzheimer's disease
 - Hypertension
 - Hypercholesterolemia
 - Type II NIDDM
 - Anxiety
- Ocular Hx:
 - Glaucoma
- Medications:
 - Systemic: Metformin, unknown meds for conditions above
 - Ocular: Lumigan QHS OU, Combigan BID OU

172

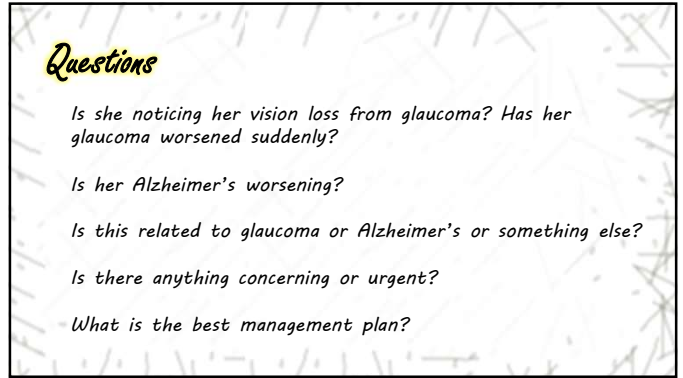

173

174

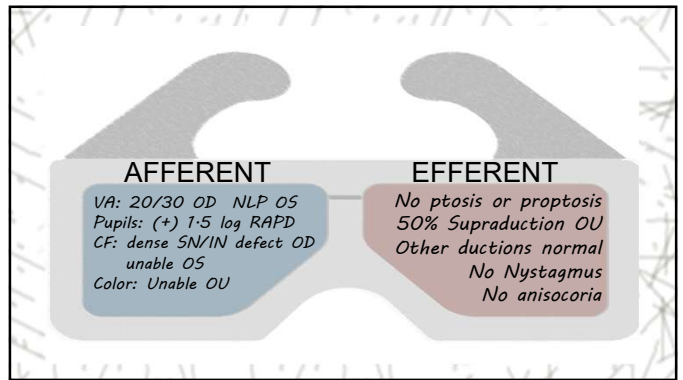

175

176

177

178

179

180

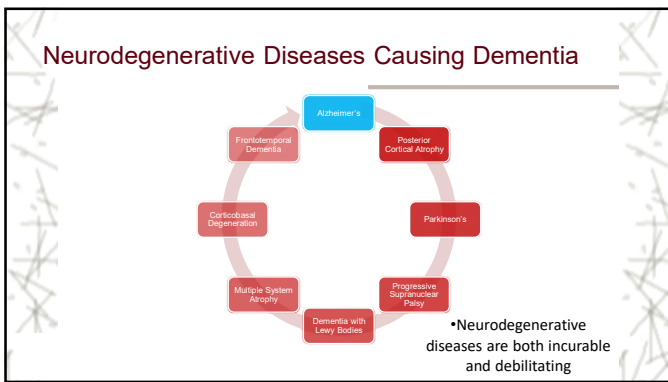

181

But, why did everything suddenly change 8 days ago?

What do we know / or still need to figure out:

1. Glaucoma is slowly progressive, but there can be fairly sudden "snuffing" of last remaining fibers.
2. There are cataracts, but they should not be causing sudden vision loss.
3. Even if blind from glaucoma, it should not affect mental status.
4. *How does Alzheimer's affect vision?*
5. *Could vision loss in someone with dementia make them less functional in other ways as well?*
6. *Could this is something unrelated, such as a stroke? (if can't rule out, need to treat as such)*

182

183

Alzheimer's Disease

- Progressive neurodegenerative disease
- **Predominantly a disorder affecting memory**
- As the disease progresses, can affect
 - Orientation
 - Attention
 - Language
 - Executive function
 - Visuospatial

Memory impairment, specifically **short-term memory loss** is the most frequent feature of AD and is usually its first manifestation.

Executive dysfunction and impaired visuospatial skills tend to be affected relatively early, while deficits in **language function and behavioral symptoms often manifest later** in the disease course.

184

AD and Afferent Function Symptoms

- Blur
- Difficulty seeing in twilight or in rain
- Colors are washed out
- Vision just is not right
- Reduced Visual Acuity
- Reduced Color Discrimination
- Reduced Contrast Sensitivity
- Visual Field Defects

Visual symptoms are very common in AD!

185

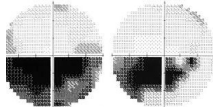

AD and Visual Acuity

- Decreased visual acuity under conditions of low luminance
- Increased prevalence of cataract affecting visual acuity

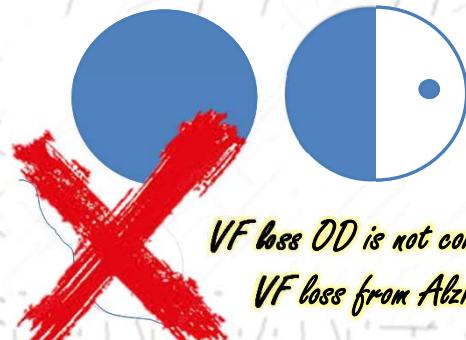

186

AD and Visual Field Defects

- **Field defects are mainly inferior**
 - Related to ganglion cell damage in superior retina
 - Characterized by accumulation of larger senile plaques and neurofibrillary tangles in the cuneal gyrus than lingual gyrus of visual cortex
- **Degree of loss correlates with degree of dementia**

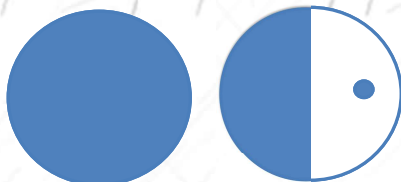

187

VF loss OD is not consistent with VF loss from Alzheimer's.

188

Alzheimer disease is the most common cause of posterior cortical atrophy.

Not so fast!

But....could it be associated with posterior cortical atrophy (PCA)?

189

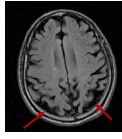

POSTERIOR CORTICAL ATROPHY

- Visual complaints may be vague
- Difficult to diagnose
- Associated with dementia
 - Can be associated with Alzheimer's Disease
 - Can also be caused by other Neurodegenerative Dz
- Progressive dementing syndromes characterized by higher visual disorders
- Progressive decline in visual processing

190

Posterior Cortical Atrophy (PCA)

- Neurodegenerative disorder most commonly associated with Alzheimer disease pathology
- Characterized by complaints of progressive visual changes
- A delay in diagnosis of PCA is common
- Search for ocular causes for visual complaints; brain MRI may be interpreted as normal

<http://radiopaedia.org/images/4634178>

191

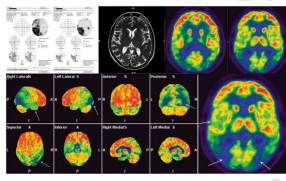

POSTERIOR CORTICAL ATROPHY

NEURO-OPHTHALMOLOGY
2017; VOL. 41, NO. 3, 154-158
<http://dx.doi.org/10.1080/09681017.2016.1278556>

PHOTO ESSAY

Homonymous Hemianopsia Due to Posterior Cortical Atrophy
Francesco Pellegrini¹, Andrew G. Lee^{2,4,5,6,7}, and Pietro Zucchetta¹

- Affects parieto-occipital cortex
- **Can cause a homonymous hemianopsia**
- MRI can appear NORMAL (no significant atrophy)
- Brain PET (positron emission tomography) or SPECT (single-photon emission computed tomography) scan shows an abnormality

192

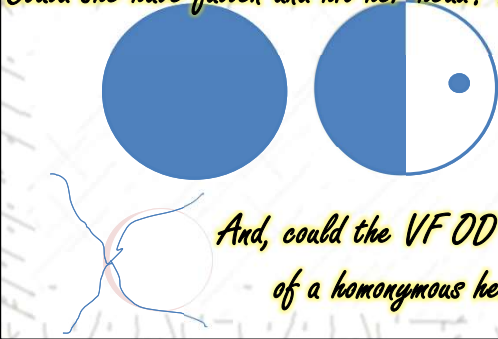

Back to AD... and Contrast Sensitivity

- **Markedly reduced contrast sensitivity**
 - *Seen in early stages of AD*
- **Significantly affects quality of life**
 - Increased risks of falls and fractures
 - Reduced reading speed
 - Increased reading latency

193

Could she have fallen and hit her head? Had stroke?

Could be; it respects the vertical meridian...

And, could the VFOD be suggestive of a homonymous hemianopia?

194

If so, what would you do about it?

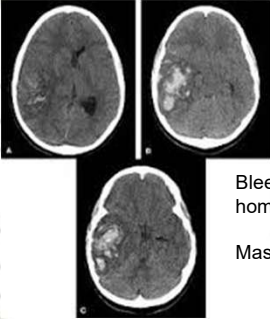

- Call / send to PCP
- Call / send to Neurologist
- Send to ED

195

- Sent patient to the ED for emergent CT scan of the brain without contrast to rule out acute intracranial pathology.
- Alzheimer's dementia / PCA should not progress so quickly.
- Alzheimer's pts are prone to falls...

196

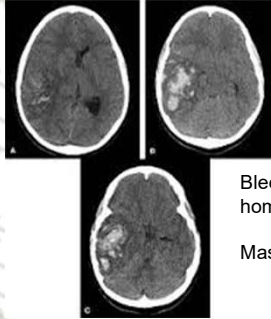

CT SCAN FINDING:
3 cm parenchymal bleed in the parietal and temporal lobes, with mass effect

Bleed on right side, consistent with left homonymous hemianopia

Mass effect, midline shift, concern for herniation

This is consistent with sudden change in mental status!

197

CT SCAN FINDING:
3 cm parenchymal bleed in the parietal and temporal lobes, with mass effect

Bleed on right side, consistent with left homonymous hemianopia

Mass effect, midline shift, concern for herniation

Underwent urgent surgical evacuation of hemorrhage

198

This was...

as real as it gets!!

199

If missed, this could have been fatal!

Alzheimer's dementia does NOT rapidly progress in 1 week!

We need to be sure NOT to attribute ALL new findings to a known underlying disease until certain of the association.

We need to be aware of clinical findings that suggest acute intracranial pathology.

Ask questions (of your pts and yourself!)

Listen to your pts (even if they cannot communicate with you!)

200

All MUST Be Treated as Medical Emergencies (sent to ED):

- Hemorrhagic Stroke
- All Intracranial Bleeding
- Ischemic Stroke
- Transient Ischemic Attack
- Acute Symptomatic Hollenhorst Plaque
- Acute CRAO, BRAO
- Sudden Unexplained Vision Loss (TVL)

Ischemic stroke

A clot blocks blood flow to an area of the brain

http://www.brainsguide.com/wg/page.php?id=3&instance_id=9

Hemorrhagic stroke

Bleeding occurs inside or around brain tissue

201

If you suspect an acute stroke

Time is Brain!

(for BOTH ischemic and hemorrhagic stroke)

- Do not complete eye exam
- Only do what you need to confirm your stroke suspicion
- Call 911 immediately
- Tell the dispatcher the patient has had an acute stroke

With a stroke...

time matters.

202

Time to brain death based on % normal blood flow

% NORMAL BLOOD FLOW	TIME TO BRAIN DEATH
NO flow	10 minutes
<30% normal flow	1 hour
30-40% normal flow	Hour to several hours
With collateral and residual flow	Up to 6 hours

Published in Neurology News - July 04, 2019

Initiating Stroke Tx 15 Minutes Earlier Can Improve Outcomes

203

Get The Patient to the RIGHT ED

IT'S A BIG DEAL FOR HOSPITALS. AN EVEN BIGGER ONE FOR THEIR PATIENTS.

Advanced Comprehensive Stroke Center

- This differs from an Advanced PRIMARY Stroke Center

204

What needs to be done?

- CT, then DWI and ADC MRI within 24-48 hours of vision loss
- Imaging (CTA) of cervical and intracranial vessels.
- EKG and echocardiogram
- Laboratory testing
 - CBC with platelets
 - Coagulation studies
 - Fasting lipid profile

Do NOT send these patients to their PCP, cardiologist, neurologist, neuro-ophthalmologist, or retinal specialist.

Do NOT try to obtain the work-up yourself.

Send to an ED with an Acute Stroke Care Center!

205

Thank You!

1,000,000 Happy Patients
